

Anisong Chanthalay

Full-Stack Product Engineer

(815) 329-9172 · anisongchan@gmail.com · [linkedin.com/in/achanthalay](https://www.linkedin.com/in/achanthalay) · github.com/im2basic · [portfolio](#)

Full-stack engineer with 5 years building production software, from enterprise Angular systems used by thousands of insurance professionals to self-shipped iOS and web products with paying users. I take ownership from blueprint to production: scoping with stakeholders, architecture, UI, backend, payments, and launch, and I mentor developers along the way.

SKILLS

Languages	TypeScript, JavaScript, Swift, C#, Python, SQL, HTML5, SCSS/CSS3
Frontend	React, Next.js, Angular 14+, SwiftUI, RxJS, NgRx, Tailwind CSS, Kendo UI, Bootstrap
Backend & Data	Node.js, Express, .NET Core (interfacing), Supabase, PostgreSQL, Prisma, SQLite/GRDB, REST APIs
AI & Automation	LLM integrations (Claude, Gemini, Groq), AI agents, n8n, Zapier, Webhooks, Claude Code, Cursor
Practices & Tools	Azure DevOps, Git, CI/CD, Agile/Scrum, Unit Testing, Accessibility (WCAG), OOP/SOLID, Stripe, Figma, Postman

EXPERIENCE

Web Developer · CCMSI

Sep 2020 – Jun 2025

- Developed and maintained Angular 14+ applications for a workers' compensation claim system used by thousands of insurance agents, backed by C#/.NET services on Azure.
- Grew from bug-fixing into owning features end-to-end, scoping requirements with the COO and executive stakeholders, facilitating scrum ceremonies, and driving delivery to deadline with full control of UI/UX.
- Designed and owned a reusable multiple-body-parts claim component (design, state management, validations, and backend API wiring) that streamlined adjuster workflows and generated ~\$1.2M in annual revenue.
- Migrated a legacy Microsoft Silverlight application to a modern Angular front-end with a C#/.NET back-end, improving maintainability and user experience.
- Mentored and coached junior and new developers, and regularly presented progress and roadmap to executives and high-level stakeholders.
- Coordinated across frontend, backend, and low-code/API teams on cross-cutting features; partnered with QA throughout the cycle, writing and executing test cases to ensure quality.
- Shipped two-way SMS + in-app chat, a prefunding feature (check holds/overrides), and PDF/Excel export tooling with dynamic rendering on Kendo UI.
- Managed CI/CD pipelines, versioning, and dependency upgrades in Azure DevOps; refactored legacy code to improve load times 20% and reduce user-reported errors 15%.

Full-Stack Engineer & Founder · Independent

Jun 2025 – Present

- Design, build, and ship subscription SaaS and iOS products end-to-end: architecture, UI/UX, backend, payments, and launch (see Projects below).
- Each product targets a real user problem and monetizes via subscription (Stripe / RevenueCat); instrumented with PostHog for product analytics and iteration.

PROJECTS

Deckly · SaaS platform for TCG vendors

decklytcg.com

- Engineered a full-stack SaaS platform using Next.js/React, Supabase (Postgres), Clerk auth, and Stripe billing to deliver secure, scalable vendor tools.

- Designed RESTful integrations with external Pokémon TCG data sources for real-time card search, pricing, and image retrieval; architected the Postgres schema for vendor inventories, sales history, and tiered pricing.

PocketWorship · iOS worship presentation app

pocketworship.com

- Designed and built a full-stack iOS app with SwiftUI, GRDB (SQLite), and Supabase (auth, database, storage, realtime, edge functions), shipping end-to-end to the App Store.
- Built an offline-first cloud sync engine (local SQLite persistence with server-anchored cursors and background sync), plus real-time slide streaming to web/devices with QR-code participation; monetized with RevenueCat.

FlipSide · real-time debate fact-checking iOS app

flipside.to

- Built a live speech-to-fact-check pipeline (streaming audio through Deepgram STT, Groq claim extraction, and Gemini verification) that surfaces sourced fact-check cards seconds after a claim is spoken.
- Hardened the backend with Supabase Edge Functions for API-key isolation, per-user quota enforcement, and RPC lockdown; instrumented with PostHog and monetized via subscription paywall.

Additional projects (StampKit, Dewy) and full case studies at personal-blueprint-portfolio.vercel.app

EDUCATION

Coding Dojo
Rock Valley College

Full Stack Software Engineer Bootcamp
Associate of Arts
