

Anisong Chanthalalay

Full-Stack Product Engineer

(815) 329-9172 · anisongchan@gmail.com · linkedin.com/in/achanthalalay · github.com/im2basic

Full-stack engineer with 5 years building production software — from enterprise Angular systems used by thousands of insurance professionals to self-shipped iOS and web products with paying users. I take ideas from blueprint to production: architecture, UI, backend, payments, and launch.

SKILLS

Languages	TypeScript, JavaScript, Swift, C#, Python, SQL, HTML5, SCSS/CSS3
Frontend	React, Next.js, Angular 14+, SwiftUI, RxJS, NgRx, Tailwind CSS, Kendo UI, Bootstrap
Backend & Data	Node.js, Express, .NET Core (interfacing), Supabase, PostgreSQL, Prisma, SQLite/GRDB, REST APIs
AI & Automation	LLM integrations (Claude, Gemini, Groq), AI agents, n8n, Zapier, Webhooks, Claude Code, Cursor, Apollo AI Sequences
Practices & Tools	Azure DevOps, Git, CI/CD, Agile/Scrum, Unit Testing, Accessibility (WCAG), OOP/SOLID, Stripe, Figma, Postman

EXPERIENCE

Web Developer — CCMSI

Sep 2020 – Jun 2025

- Developed and maintained Angular 14+ applications for a workers' compensation claim system used by thousands of insurance agents, backed by C#/.NET services on Azure.
- Converted a legacy Microsoft Silverlight application into a modern Angular front-end with a C#/.NET back-end, improving maintainability and user experience.
- Designed a reusable multiple-body-parts claim component that streamlined adjuster workflows and improved data integrity, generating ~\$1.2M in annual revenue for CCMSI.
- Designed and launched two-way SMS + in-app chat, letting clients reach adjusters and get real-time assistance.
- Implemented a prefunding feature supporting check holds and overrides for account balance management.
- Built PDF & Excel export tooling with dynamic rendering and formatting on Kendo UI.
- Debugged, tested, and refactored legacy code, improving load times by 20% and reducing user-reported errors by 15%; collaborated with QA and product in Agile sprints to sustain high release velocity.

PROJECTS

Deckly — SaaS platform for TCG vendors

decklytcg.com

- Engineered a full-stack SaaS platform using Next.js/React, Supabase (Postgres), Clerk auth, and Stripe billing to deliver secure, scalable vendor tools.
- Designed RESTful integrations with external Pokémon TCG data sources for real-time card search, pricing, and image retrieval; architected the Postgres schema for vendor inventories, sales history, and tiered pricing.
- Built responsive, mobile-first UI with Next.js and Tailwind, ensuring smooth vendor workflows on any device.

PocketWorship — iOS worship presentation app

pocketworship.com

- Designed and built a full-stack iOS app with SwiftUI, GRDB (SQLite), and Supabase (auth, database, storage, realtime, edge functions), shipping end-to-end from architecture to the App Store.
- Developed an offline-first cloud sync engine — local SQLite persistence with server-anchored cursors and background synchronization to Supabase — ensuring data availability regardless of network state.
- Implemented real-time slide streaming to web viewers and streaming devices via Supabase Realtime and Edge Functions, enabling QR-code audience participation with no extra hardware; monetized with RevenueCat subscriptions.

FlipSide — real-time debate fact-checking iOS app

- Built a live speech-to-fact-check pipeline — streaming audio through Deepgram STT, Groq claim extraction, and Gemini verification — surfacing sourced fact-check cards seconds after a claim is spoken.
- Hardened the backend with Supabase Edge Functions for API-key isolation, per-user quota enforcement, and RPC lockdown; instrumented with PostHog and monetized via subscription paywall.

EDUCATION

Coding Dojo

Full Stack Software Engineer Bootcamp

Rock Valley College

Associate of Arts
